

# Models in DBT

16 July 2025 13:49

- Models are basic building blocks for Business Logic
- Materialized as tables, views, etc..
- They Live in SQL Files in the `models` folder.
- Models can reference each other and use templates and macros

For Models we will make use CTE:

1. CTEs are long length of executable continuous SQL statements.
2. They can be included in transformations and Insertions together.

For our AIRBNB Example we will follow The following data flow process:

We will create views for each of the Raw tables.

We will create all the views in the models directory and then run dbt-run in the terminal this will create all the views in dev schema
