

Tests

22 July 2025 10:14

There are two unique tests in DBT: Singular and generic.

Singular tests are SQL queries stored in tests which are expected to return an empty result set

There are four built in generic tests:

1. Unique
2. Not_null
3. Accepted_values
4. Relationships

You can define your custom generic tests or import tests from dbt packages

We can define **generic tests** using **schema.yml** files.

We can run the test files using **dbt test** .

To run only specified files use **dbt test -- <filename>**
