

Materialization

16 July 2025 14:24

Materialization has 4 build targets :

1. Views:

Use case:

1. For lightweight representation
2. When data is not reuse data often

When not to use:

When we read from same model several times

2. Table:

Use case:

1. When We want to read from model several times

When not to use:

1. Building single-use models
2. When model is populated incrementally

3. Incremental(Table Appends):

Use case:

1. Fact tables
2. Append to Tables

When not to use:

1. Want to update historical records

4. Ephemeral:

Use case:

1. When we merely want an alias to your data

When not to use:

Read from the same model several times

For our Airbnb project:

1. We will create a **dim_list_cleaned** from **src_listing view**
2. We will create a **dim_host_cleaned** from **src_hosts view**
3. Finally we will create a **fact dimension fct_reviews** from **src_views**.
4. Finally we will join all of these for form a final **dim_listing_with_hosts** final dimension table.

All dimensions will be placed in the dim folder in model directory and all fact tables are stored in the fact folder in the model directory .

Materialization uses ref jinja keyword to access files inside the same directory.

Whatever we apply in the **dbt_project.yml** file will be used by dbt to create a tables in snowflake.

For refresh of all the tables in dbt use the **dbt run --full --refresh**
