

Seeds and Sources

16 July 2025 15:55

Seeds are local file that you placed upload data to data warehouse from dbt.
Sources is an abstractions layers on the top of your input tables.
Sources freshness can be checked automatically.

For this exercise download the file from the below link

https://dbtlearn.s3.us-east-2.amazonaws.com/seed_full_moon_dates.csv

In the dbt learn folder, we can use **curl <above link> -O seeds/seed_full_moon_dates.csv**
Now we can use dbt seed which will upload the file with the same name into snowflake

Sources are abstraction on top of our input data. It gives extra features just like checking data freshness.
